

# Python Django

## Install, App & Superuser Django

1. **Prerequisites:** Ensure you have Python installed. Django requires Python 3.6 or higher.
  2. **Create a Virtual Environment:** It's good practice to create a virtual environment for your Django project to manage dependencies separately:
    - **Using Command:** `python -m venv myenv`After that, go to the environment file using `cd myenv` and activate the environment
    - **Using Command:** `myenv\Scripts\activate`  
`.\myenv\Scripts\activete`
  3. **Install Django:** Install Django using pip:
    - **Using Command:** `pip install django`
  4. **Create a Django Project:** Back to the main folder using `cd ../` After that, use the `django-admin` command to create a new project:
    - **Using Command:** `django-admin startproject myproject`
  5. **Navigate to Your Project Directory:** Go into your project directory:
    - **Using Command:** `cd myproject`
  6. **Start the Development Server:** Run the development server
    - **Using Command :** `python manage.py runserver`
  7. **Access Your Project:** `http://127.0.0.1:8000/`
- 

## Django App

8. **Create a new app:** Use the `startapp` command. Replace `myapp` with your desired app name
  - **Using Command:** `python manage.py startapp myapp`
9. **Register the app in:** Open `myproject/settings.py` and add your app to the `INSTALLED_APPS` list:
  - **Using Code:** `INSTALLED_APPS = [`  
 `'django.contrib.staticfiles',`  
 `'myapp',`  
`]`

## Django Superuser

**10. Ensure your project is set up and migrated:** Run the following command

- **Using Command:** `python manage.py makemigrations`  
`: python manage.py migrate`

**11. Create the superuser:** Run the following command

- **Using Command:** `python manage.py createsuperuser`

**12. Enter user details when prompted:** You'll be asked for

- **Username**
- **Email address**
- **Password** (enter and confirm; it won't be shown as you type)

## CRUD Operation
